

BAR, CIRCLE, AND LINE GRAPHS

What Are Bar, Circle, and Line Graphs?

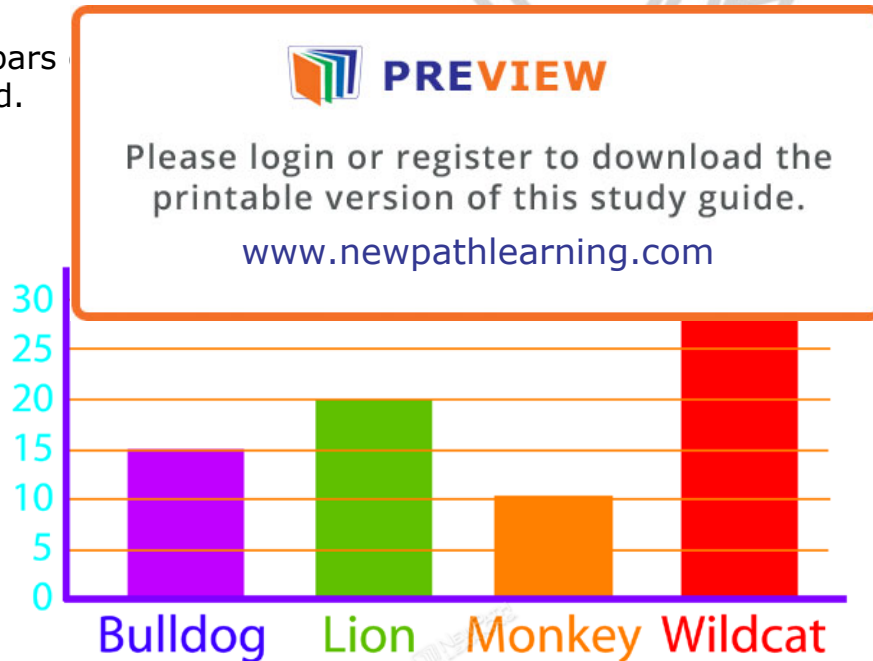

Bar Graphs are used to compare data. A bar graph is used to show relationships between groups.

Circle Graphs are also known as Pie graphs or charts. They consist of a circle divided into parts. The different parts show different amounts, sizes, or numbers of various data. The data is usually in percentages and plotted proportionally within a circle, meaning each portion of the circle will add up to 100% when added together.

Line Graphs show gradual changes in data.

How to read and interpret Bar, Circle, and Line Graphs:

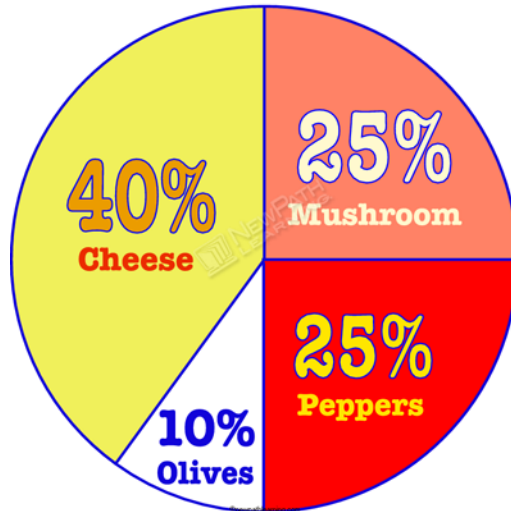

Use the bars compared.

There were 75 votes in all for mascots.

Use the percentages on a Circle Graph to determine the data being shown.
