

VOLUME/CAPACITY

What is volume?

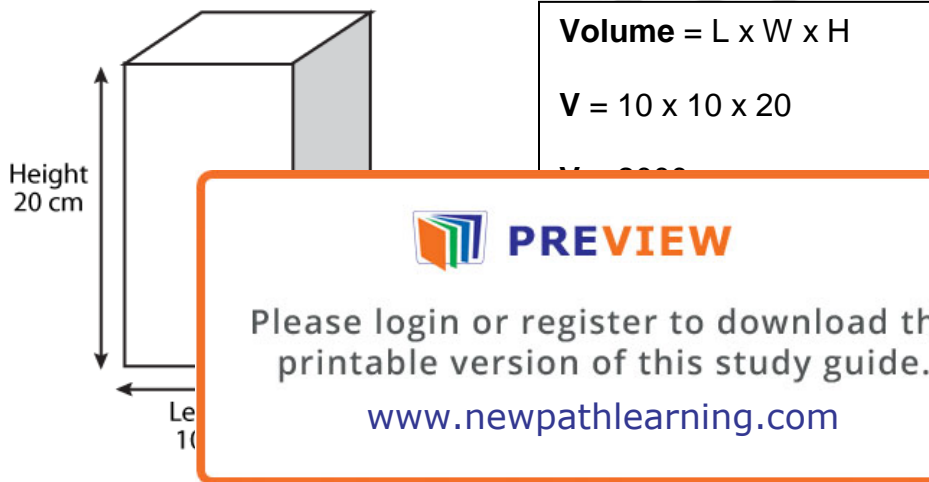

Volume is the 3-dimensional size of an object, such as a box.

How to find the volume of a rectangular prism:

The volume of a rectangular prism can be found by the formula:

$$\text{Volume} = \text{Length} \times \text{Width} \times \text{Height}$$

Example:

Height 20 cm

Length 10 cm

Volume = L x W x H

V = 10 x 10 x 20

Try this!

V = _____

V = _____

What is capacity?

Capacity is the amount a 3-dimensional object can hold or carry. It can also be thought of the measure of volume of a 3-dimensional object.

How to determine capacity:

The common measures of volume in the U.S. system of measurements are:

tablespoons = 3 teaspoons

fluid ounces = 2 tablespoons, 6 teaspoons

cups = 8 fluid ounces, 16 tablespoons

pints = 2 cups, 16 fluid ounces

quarts = 2 pints, 4 cups

gallons = 4 quarts, 8 pints, 16 cups

- Convert gallons to pints by multiplying the number of gallons by 8.
- Convert quarts to pints by multiplying the number of quarts by 2.
- Add the amount together.
- Perform the division to find the number of pints.
- Convert the number of pints to the number of quarts.
- The quotient is the number of quarts. The remainder is the number of extra pints.
- Convert the number of extra pints to fluid ounces by multiplying by 2.
- The quotient is the number of fluid ounces. The remainder is the number of pints.

Example:

Convert the following: 1 gallon = _____ pints

1 gallon = 8 pints

Try this!

Convert the following: 1 quart = _____ gallons

Convert the following: 3 gallons = _____ cups
